Title Page

Journal: Frontiers in Signal Processing

Specialty section: Biomedical Signal Processing

Article type: Original Research

Title: Self-supervised biomedical signal representation learning from intrapartum cardiotocography for neonatal risk enrichment

Running title: Self-supervised CTG signal representation

Equal contribution: Xiaoqian Gui, Kaisi Zhu and Ziyi Jiang contributed equally to this work.

Corresponding author: Feifan Lu, Department of Obstetrics and Gynecology, Changhai Hospital, Naval Medical University, Shanghai, China. Email: luff94@163.com

Keywords: cardiotocography, biomedical signal processing, self-supervised learning, time-series representation learning, fetal heart rate, uterine contraction, neonatal risk, calibration

Funding: This work received no external funding.

Conflict of interest: The authors declare no competing interests.

Ethics statement: This study used publicly available, de-identified datasets and did not involve direct recruitment of human participants.

Data and code availability: Public datasets are available from their original repositories. Derived source-data tables, supplementary tables, analysis code and manuscript source files are archived at `https://doi.org/10.5281/zenodo.20376424` and `https://github.com/Luciky-Leo/ctg-foundation-trajectory`.
